

**METHOD, APPARATUS, AND COMPUTER PROGRAM PRODUCT FOR  
IMPLEMENTING ENHANCED QUERY GOVERNOR FUNCTIONS**

Abstract of the Disclosure

5       A method, apparatus and computer program product are provided for  
implementing enhanced query governor functions. Query execution includes  
first checking for a timeout value for a query. Responsive to identifying a  
timeout value for the query, an execution time for the query is reset and a  
monitor for each timeout value for the query is started. Then the execution  
of the query is started. The execution of predefined events is monitored  
10   during the execution of the query. The predefined events include a begin or  
end of processing of at least one of a trigger and a user defined function  
(UDF). Execution status of the query is periodically checked. Responsive to  
identifying the query is executing, checking for any expired timeout value is  
performed. The execution of the query is halted responsive to an identified  
15   expired timeout value.
